※Cautions for consisting MPDP System

WARNING

Caution for the other control program besides MPDP Control Program (MSCS)

- If you want to use automatic power on/off function that make MPDP turned on/ off by connecting main power, allow at least 20 seconds of Stand-by time before MPDP is turned on, when you make control program.

- If RS-232C communication signal or other image signal is applied to 9 or more sets simultaneously, communicational error may occur. (Power on & Broadcast)

Environmental condition for installation

- Since MPDP panel is very sensitive for physical impact, installation requires considerable caution.

- Minimum clearance(20cm) must be secured for smooth ventilation. (See P16~17)Installation must avoid air tight or near air tight places. Improper ventilation causes malfunction and shortens product lifetime by rapid internal temperature rise. If MPDP has to be installed at the improper ventilation, additional ventilation openings or fans must be provided to keep the internal temperature between 0 ~ 35℃.

- For ground of MPDP and application devices, it should be connected as frame ground.

- Considering MPDP Max power consumption, check the main electric specification.

※ Please be noted that the film filter on the front surface of the panel may lose its color or change the color rapidly, if it is exposed to sunlight or ultraviolet rays.

※ If the internal temperature reaches to 90℃, "High Temperature" signal will be displayed at the lower left corner on the screen for 1minute and the MPDPset will be turned off automatically.

Consideration for easier service

- When you design the exterior design for MPDP system, consider easier disassembly for possible service occasion in the future.

- The sliding Universal Unit of ORION is recommended for easier service.

- If service people can step into the backside of MPDP system, it can greatly reduce time and effort for service.

- In case of higher locations, consider the installation location and exterior design for easier service.

WARNING

※Clearance for Ventilation

- When you install MPDP, make sure there is at least 20cm clearance for effective ventilation and do not seal off MPDP sets.
If MPDP sets are installed at the locations of bad ventilation, the inner temperature can be raised rapidly and it can cause frequent malfunctions and rapid reduction of the product life.
※ Ventilation space in front of MPDP must be furnished for heat dispersion. If the front space of MPDP has to be sealed, there must be consideration for the heat dispersion in the rear side of MPDP.

※Do not cover the vent hole for the fan

-Carefully install MPDP not to cover the fan air holes with any structural object.
If the holes are covered with anything, the inner temperature can be raised rapidly and it can cause malfunctions.

FAN
※Cleaning and Maintenance

-Regularly clean off the vent holes in the back of MPDP sets.
If the vent holes and the fan air holes are clogged with dust, it prevents the air flow inside of MPDP sets.
It can cause rapid increase of the inner temperature and may cause malfunctions.
Clean off the vent holes and the fan air holes with a vacuum cleaner regularly.

7. MSCS Protocol

1. Introduction

This chapter contains the communication protocol between PDP and its control devices such as computer for better use of the product. However, it does not include detailed technical matters. It rather focuses on the brief functional explanation and communication protocol.
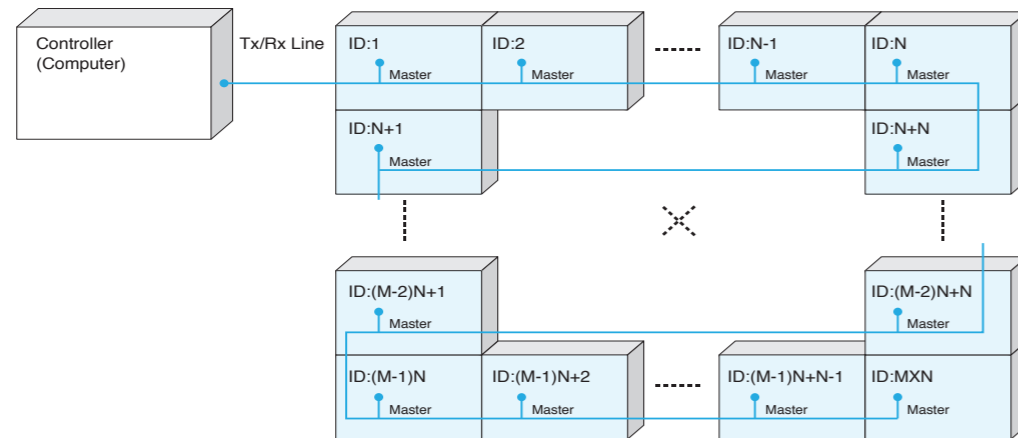

※ The connection can be variable based on environment or the users' intention.
< Communication connection diagram >

1.1. Communication Setting

- Transmission & Reception type: Asynchronous Serial Communication
- Connection type: Daisy Chain
- Baudrate :   115200
- Data Bits :   8
- Parity :   None
- Stop Bits :   1
- Flow Control :   None

2. Protocol Format

2.1. Send To PDP

STX	Command	Length	Data	ETX
1 byte	1 byte	1 byte	Variable	1 byte

ID	Master	Other Data
1 byte	1 byte	N byte

- This is how to send commands to PDP. Only the set of the designated ID is working according to the "Command." But, if the "ID" value is "0", all MPDP sets are working according to command as "Broadcast".
- STX(0x02): The initial code. It means the beginning of Protocol. (Fixed value)
- Command: Code for actual operation. (Variable)
- Length: the length of "Data" area. (Variable: 0~255)
- Data: the areas for "ID" and the other Data (Variable)
- ID: It is a code to distinguish PDP sets. Its range is "0" to "255". If the ID is "0," it means Broadcast command.(variable)
- Master(0x01) : This is the scaler code.
- ETX(0x03): The end of the code. (Fixed value)

2.2. Receive From PDP

STX	CMD	Length	Data	Check Sum	ETX
1 byte	1 byte	1 byte	Variable	1 byte	1 byte

ID	Master	Other Data
1 byte	1 byte	N byte

- Response by a certain command from the designated set among MPDP sets. The difference from "Send to PDP" is "Check sum".
- STX(0x02): The initial code. It means the beginning of Protocol. (Fixed value)
- Command: Code for actual operation. (Variable)
- Length: the length of "Data" area. (Variable: 0~255)
- Data: the areas for "ID" and the other Data (Variable)
- ID: Set identification (0~255) (Variable)
- Master(0x01) : This is the scaler code.
- Check sum: execute "Not" operation after adding all the values in "STX~Data" area.
- ETX(0x03): The end of the code. (Fixed value))

- Communication Sequence
   * Wait for 50msec for response after sending the command. If there is no response, it is recommended to resend the command.
   * It is recommended that not sending the other command or changing input resolution during command transmission.

Command transmission	$\rightarrow$ $\leftarrow$	Responsetransmission

8. Other tips

8.1. Before calling for service

• Before calling for any repair, check the following and then refer to a near A/S center.
▶ "Tick" sound from the main body.

• If there is no problem with the screen or sound, the "tick" sound is likely to result from the cabinet lightly shrinking with the change of room temperature. The sound does not affect product's performance.
▶ No image at upper and lower part of the screen.

• As for a screen which is over 16:9 in width (such as cinema-sized one), no image may be displayed at upper and bottom part of the screen.
▶ Speckles or white lines on the screen

• Check whether the problem is caused by vehicle, streetcar, high-voltage cable or neon sign, which emitting interference wave or electromagnetic induction. Avoid any interfering object.
▶ Screen or PDP Set is hot

• PDP sets or screen can be hot, because basic principle of PDP driving is Plasma discharge between electrodes.
• It is not a defect or a malfunction of the product, you may continue to use the product.

8.2. About Plasma display panel

- The followings are phenomena caused by characteristics of the plasma display panel.
- Since it is not a fault, you may continue to use the product.
▶ **Black or twinkling spots on the screen**

⚠ Caution
- Although the plasma display panel is manufactured with high-precision technology, there may exist black or twinkling spots on the screen.
 Since it is not a fault, you may continue to use the product.
▶ **Burn-In effect**

⚠ Caution
- Displaying static images such as still video frames or computer screen images for an extended period of time may cause burn-in effect.
  The burn-in effect may be gradually reduced by displaying full white pattern.
- However, please always be careful in using static images on this product, because such burn-in effect may cause permanent damages in some cases.

▶ **Noise from the inside**

⚠ Caution
- When you turn on the product slight buzzing sound may be heard from the rear of display panel. Since it is not a fault, you may continue to use the product.
▶ **Screen decolorization**

⚠ Caution
- Optical film that is attached on the panel can be slightly decolorized after long time of use. The degree of decolorization may vary depending on display contents and conditions.
  It is due to the characteristics of the film, but it is not a defect.
  (It is caused by chemical characteristics of the film.)
